Abstract

Service Hub Directory is a web-based application that connects customers with reliable local service providers such as electricians, plumbers, carpenters, beauticians, tutors, photographers, and computer technicians.

It offers a centralized platform where users can search for services, view provider details, and submit service requests, while providers can register, manage profiles, and respond to requests efficiently.

A unique Customer Loyalty Rewards Module gives users gift vouchers or discount coupons after every ten completed service requests, encouraging repeated use of the platform.

7

Core Modules

10

Services = 1 Reward

3

Tier Stack: HTML/CSS/JS, Python, MySQL

Introduction

1

Everyday Need

Households and businesses regularly need trusted electricians, plumbers, carpenters, tutors and other local professionals, but finding one quickly is often difficult.

2

Fragmented Discovery

Customers rely on word-of-mouth, scattered ads, or unreliable classifieds, with no single place to compare and choose a verified provider.

3

A Digital Bridge

Service Hub Directory is built to bridge this gap - a single web platform where customers and local service providers can connect, transact, and build trust.

4

Two-Sided Platform

The system serves both sides: customers who need services, and providers who want visibility, bookings, and repeat business.

Problem Statement

- 1 No centralized platform to search, compare, and book verified local service providers.
- 2 Customers struggle to judge provider reliability without genuine reviews or ratings.
- 3 Service providers lack an easy way to advertise, manage requests, and grow their customer base online.
- 4 No system exists to reward loyal, repeat customers - reducing platform stickiness and provider engagement.
- 5 Manual coordination (calls, word-of-mouth) leads to delays, miscommunication, and missed appointments.

OBJECTIVES

1

Build a centralized web platform to connect customers with verified local service providers.

2

Enable easy registration, profile management, and login for both customers and providers.

3

Allow customers to browse categories and submit service requests seamlessly.

4

Let providers manage requests, accept or reject bookings, and update service details.

5

Introduce a review & rating system to promote transparency and provider accountability.

6

Implement a Customer Loyalty Rewards Module to encourage repeat platform usage.

Literature Review

Existing Approach	Limitation	Our Improvement
Existing Local Directories (e.g. Justdial-type listings)	List providers but rarely verify quality; no in-app booking or request tracking.	Verified provider profiles with in-app requests and status tracking.
On-Demand Service Apps	Focus on a single service category and use commission-heavy, provider-managed onboarding.	Multi-category directory covering electricians, plumbers, tutors, and more.
Classifieds & Word-of-Mouth	Unstructured, no accountability, and no record of past service quality.	Structured review & rating system builds long-term accountability.
Generic Booking Systems	Rarely reward repeat customers or build platform loyalty.	Dedicated Loyalty Rewards Module for every ten completed services.

Methodology

Technical Approach

The system follows a modular, three-tier architecture. The presentation layer (HTML, CSS, JavaScript with Bootstrap) handles user interaction; the application layer (Python / Flask) implements business logic and routing for each module; and the data layer (MySQL) stores users, providers, requests, reviews, and reward records. Each module - registration, provider management, requests, reviews, and rewards - is built and tested independently before integration.

Software & Hardware Requirements

Software Requirements

Front-End	HTML5, CSS3, JavaScript, Bootstrap 5
Back-End	Python (Flask Framework)
Database	MySQL
IDE / Editor	Pycharm
Operating System	Windows 11
Browser	Google Chrome / Microsoft Edge

Hardware Requirements

Device	HP Laptop
Processor	Intel Core i5
RAM	8 GB (minimum, recommended)
Storage	512 GB SSD / HDD (typical)
Display	14" - 15.6" HD Display
Connectivity	Wi-Fi for local server access

System Modules

1

User Management

2

Service Provider Management

3

Service Category

4

Service Request

5

Review & Rating

6

Customer Loyalty Rewards

7

Admin Panel

Module Description

1

User Management Module

Allows users to create an account, log in securely, manage their profile, browse service categories, and submit service requests through the platform.

2

Service Provider Management Module

Enables service providers to register, update their profile, add service details, and manage customer service requests efficiently.

3

Service Category Module

Organizes all services into different categories, allowing users to easily browse and locate the required service providers.

4

Service Request Module

Allows users to send service requests to providers, while providers can accept or reject the requests and update their status.

Module Description

5

Review and Rating Module

Enables users to provide ratings and reviews after the completion of a service, helping improve transparency and service quality.

6

Customer Loyalty Rewards Module

Tracks completed service requests and rewards users with gift vouchers or coupons after every ten successful services, encouraging customer loyalty.

7

Admin Module

Allows the administrator to manage users, service providers, service categories, service requests, reviews, rewards, and overall system operations.
